BEST AVAILABLE CONTROL TECHNOLOGY DETERMINATION

DETERMINATION NO.: 118 & 119
DATE: Feb 8, 2016
ENGINEER: Jeffrey Quok

Category/General Equip Description: Coating, Stripping, and Solvent Cleaning – Wood
Equipment Specific Description: Paint Spray Booth
<1,170 lbs VOC/month and ≤4,663 lbs VOC/year for facilities emitting ≤ 20 tons VOC/year (BACT #118)
≥1,170 lbs VOC/month or >4,663 lbs VOC/year for facilities emitting ≤ 20 tons VOC/year (BACT #119)
Equipment Size/Rating:
Previous BACT Det. No.: 52

This BACT determination will update Determination #52 for paint spray booths used for wood coating operations. This BACT determination will also include stripping and solvent cleaning operations related to wood coating operations. Additionally, this determination is being updated to include T-BACT for HAPs associated with VOC and PM emissions.

This BACT was determined under the project for A/C 24531 (California Cabinet & Store Fixtures).

BACT/T-BACT ANALYSIS

- (A) Typical technology to meet this BACT is use of coatings with very low VOC contents (such as waterborne coatings, higher solids coatings, UV-cured coatings, polyester or polyurethane coatings, higher solids nitrocellulose lacquers, and solvent-substituted coatings).
- (B) SDAPCD Rule 67.11 contains the most stringent VOC limit (200 g/l) for stripping materials. However, per conversations with SDAPCD, facilities in their county have been complying with this rule by meeting the alternate stripping requirement of the stripping material having a total VOC vapor pressure of 2 mm Hg or less, at 20°C (68°F). Therefore the 200 g/l won't be considered achieved in practice.
- (C) SJVAPCD Rule 4606 contains the most stringent VOC limit (240 g/l) for high-solid stains. However, per BAAQMD's Wood Products Coatings Workshop Report (4/09), CARB and every coating manufacturer has indicated there are on-going implementation issues with high-solid stains meeting the 240 g/l VOC limit. Therefore this limit won't be considered achieved in practice.

The following control technologies have been identified as the most stringent, achieved in practice control technologies:

B. TECHNOLOGICALLY FEASIBLE AND COST EFFECTIVE (Rule 202, §205.1.b.):

Technologically Feasible Alternatives:

Any alternative basic equipment, fuel, process, emission control device or technique, singly or in combination, determined to be technologically feasible by the Air Pollution Control Officer.

The table below shows the technologically feasible alternatives identified as capable of reducing emissions beyond the levels determined to be "Achieved in Practice" as per Rule 202, §205.1.a.

VOC	1. Carbon Adsorber 2. Thermal Oxidizer
NOx	No other technologically feasible option identified
SOx	No other technologically feasible option identified
PM10	No other technologically feasible option identified
PM2.5	No other technologically feasible option identified
CO	No other technologically feasible option identified

Cost Effective Determination:

After identifying the technologically feasible control options, a cost analysis is performed to take into consideration economic impacts for all technologically feasible controls identified.

Maximum Cost per Ton of Air Pollutants Controlled

1. A control technology is considered to be cost-effective if the cost of controlling one ton of that air pollutant is less than the limits specified below:

<u>Pollutant</u>	<u>Maximum Cost (\$/ton)</u>
VOC	17,500
NO _x	24,500
PM ₁₀	11,400
SO _x	18,300
CO	TBD if BACT triggered

Cost Effectiveness Analysis Summary

A previous cost effectiveness analysis determined that 4,700 lb VOC/year was the highest allowable uncontrolled emission rate that did not require any add-on control devices. This BACT determination will revisit this limit by using new control efficiency data. The new BACT

determination will use a control efficiency of 90% (previously 85.5%) per BAAQMD's BACT determination. In order to find the highest allowable annual VOC emission limit that does not result in carbon adsorption being cost effective, the cost analysis performed for this permit was done with the emission limit as a variable. See Appendix A - *Determination of Maximum Annual VOC Limit Not Requiring Add-on BACT* for this analysis. The resulting maximum annual VOC emission limit, 4,663 lb VOC/year, will be the set limit for this determination. Using 4,663 lb VOC/year as the maximum emission rate, a cost effective analysis for carbon adsorption and incineration was performed below.

Carbon Adsorber:

As shown in Attachment C, the cost effectiveness for the add on carbon adsorber system to control VOC was calculated to be **\$17,500.46/ton** (see attached Paint Spray Booth Cost for Wood Coating Effectiveness Analysis). The following basic parameters were used in the analysis.

Equipment Life = 10 years

Total Capital Investment = \$9,756.24

Direct Annual Cost = \$31,031.91 per year

Indirect Annual Cost = \$5,690.18 per year

Total Annual Cost = \$36,722.09 per year

VOC Removed = 2.1 tons per year

Cost of VOC Removal = \$17,500.46 per ton reduced

Therefore, the add on carbon adsorber system is considered not cost effective and is eliminated.

Thermal Oxidizer:

Equipment Life = 10 years

Direct Cost = \$217,390

Direct Annual Cost = \$110,349.05 per year

Indirect Annual Cost = \$57,091.34 per year

Total Annual Cost = \$167,440.39 per year

VOC Removed = 2.1 tons per year

Cost of VOC Removal = \$79,830.45 per ton reduced

C. SELECTION OF BACT/T-BACT:

Based on the review of SMAQMD, SCAQMD, SDCAPCD, BAAQMD, SJVAPCD, ARB, and EPA BACT Clearinghouses and cost effectiveness determinations, BACT for VOC, PM10, and PM2.5 will be the following:
