SACRAMENTO METROPOLITAN

BEST AVAILABLE CONTROL TECHNOLOGY & TOXIC BEST AVAILABLE CONTROL TECHNOLOGY DETERMINATION

	DETERMINATION NO.:	145	
	DATE:	December 13, 2016	
	ENGINEER:	Felix Trujillo, Jr.	
Category/General Equip Description:	Pet Crematory		
Equipment Specific Description:	Pet Crematory Minor Source BACT;4.5 MMBtu/hr Burners @ 4,380 hours/year of operation (19,710 MMBtu/year) and ≤		
Equipment Size/Rating:	681 Tons Charge/year	, minibita, your) and =	
Previous BACT Det. No.:	N/A		

A review of the SVCAPCD, SCAQMD and BAAQMD BACT Clearinghouses showed no distinction between a pet crematory and human crematory. A prior version (BACT No. 1.9.3.A) of the SJVAPCD's crematory BACT was based on a pet crematory. The SMAQMD performed a BACT determination (No. # 133) for a Human crematory on 7/12/16. Therefore, BACT No. 133 will be referenced for this new BACT.

This BACT was determined under the project for A/C's 25086 & 25901 (Treasured Pets). The BACT was based on the largest crematory (A/C 25091).

BACT ANALYSIS

A: ACHIEVED IN PRACTICE (Rule 202, §205.1a)

The following control technologies are currently employed as BACT for crematories.

		(afterburner) ≥ 1600 °F	
Valley APCD			
	PM2.5	No Standard	
	CO	No Standard	
	Rule Requirements		
	None		

The following control technologies have been identified and are ranked based on stringency:

	SUMMARY OF ACHIEVED IN PRACTICE CONTROL TECHNOLOGIES						
VOC	No Standard						
	1)Natural gas fuel and a secondary combustion chamber (afterburner) ≥ 1600 °F, SMAQMD, SJVUAPCD						
	2)Natural gas fuel and a secondary combustion chamber (afterburner) ≥ 1500 °F, SMAQMD, BAAQMD						
NOx	60 ppm at 3% O2 or 0.073 lb/MMBTU measurement of the fuel burned only, SCAQMD						
SOx	No Standard, Natural Gas Fuel.						
PM10	No Standard,						
	 Natural gas-fired with secondary chamber operating at ≥1600 °F SMAQMD, 						
	SJVAPCD, BAAQMD						
	 Natural Gas, Secondary Chamber ≥ 1500 °F, SCAQMD 						
PM2.5	No Standard						
CO	No Standard, Secondary Chamber ≥ 1500 °F, BAAQMD						

The following control technologies have been identified as the most stringent, achieved in practice control technologies:

	BEST CONTROL TECHNOLOGIES ACHIEVED					
Pollutant	Standard	Source				
VOC	No Standard, Natural gas fuel and a secondary combustion chamber (afterburner) ≥ 1600 °F	SMAQMD, SJVUAPCD				
NOx	60 ppm at 3% O2 or 0.073 lb/MMBTU at a process temperature of ≥ 1200 °F	SCAQMD				
SOx	No Standard, Natural Gas Fired	SCAQMD, SMAQMD, BAAQMD, SJVAPCD				
PM10	No Standard, Natural gas-fired with secondary chamber operating at ≥1600 °F	SMAQMD, SJVAPCD, BAAQMD				
PM2.5	No Standard					
CO	No Standard, Secondary Chamber ≥ 1500 °F	BAAQMD				

B. TECHNOLOGICALLY FEASIBLE AND COST EFFECTIVE (Rule 202, §205.1.b.):

Technologically Feasible Alternatives:

Any alternative basic equipment, fuel, process, emission control device or technique, singly or in combination, determined to be technologically feasible and cost effective by the Air Pollution Control Officer.

Updated in 2005, the SJVAPCD lists the use of a baghouse with a dry scrubber or a wet scrubber as technologically feasible for the control of SOx, the use of a venturi scrubber for the control of PM10 and the use of selective catalytic reduction (SCR) or a low NOx burner for the control of NOx. The control strategies appear to be carryovers from other natural gas combustion operations and do not appear to be fully evaluated for a crematory. The BAAQMD evaluated the same source category in 2007 and do not list a baghouse, venturi scrubber, the use of an SCR or a low NOx burner as technologically feasible options. No other district lists these options as technologically feasible either. Additionally SMAQMD contacted SJVAPCD (Manuel Salinas, 559-230-5833) and verified that an SCR, low NOx burner, baghouse or scrubber has not been installed on any crematories to date. Irrespective of the discussion above that questions San Joaquin's intent for listing add on controls as being technologically feasible for a crematory application, the following analysis will assume that add on controls are technologically feasible and a cost effectiveness determination needs to be conducted to determine if add on controls are in fact considered cost effective. The driving factor for this BACT determination is the multipollutant cost effectiveness thresholds for SOx and PM10 calculated down below. The limiting factor was based on yearly cremation of 681 tons/year and assuming the 4.5 MMBtu/hr burners operate 12 hours/day and 365 days/year. The life of the equipment was based on the life recommended in the cost manual. The interest was based on the previous 6-month average interest rate on US Treasury Securities + 2 points and rounding up to the next integer rate. The labor costs were based on data from the Bureau of Labor Statistics (operating labor: Occupation Code 49-9099, maintenance labor: Occupation Code 51-9051).

BACT & T-BACT Determination Pet Crematory December 13, 2016 Page 8 of 26

NOx:

A cost effectiveness analysis was done to determine if an SCR system could be considered cost effective to control the NOx from a crematory and is calculated in Appendix A of this document. The crematory is estimated to have a burner that when fired only on natural gas with no body will emit NOx at less than 60 PPM. To estimate the NOx emissions attributed to the burning of the charge, AP-42 Chapter 2.3 - Medical Waste Incineration Table 2.3-1 was used. This value for NOx is 3.56 lb of NOx per ton of charge. The NOx emissions from natural gas coumbustion were based on the total burner rating of 4.5 MMBtu/hr and an operation time of 12 hours/day and 365 days/year. As a worst case assumption, and consistent with the crematory permitting manual of the BAAQMD, the NOx emission factor that is used in this analysis will be the combined emission factor of 5.67 lb of NOx/ton of charge which includes the emission factor of natural gas combustion added to the emission factor from burning of the charge.

The total charge would be 720 tons per year. With an SCR NOx control efficiency of 90%, the NOx emissions from the crematory is calculated to be 0.19 tons per year (681*5.67*(1-0.9)/2000=0.19).

A cost for a SCR system was estimated using EPA's Cost Control Manual, 6th Edition. The SCR sizing criteria for which the costs are based are primarily determined from the exhaust flow rate and temperature. The spreadsheet that was used determines the flow rate from the burner rating. However, a crematory unit's flow rate is much larger than the flow rate estimated from the burner rating alone as it is dependent on exhaust generated from natural gas combustion, exhaust generated from the charge itself, and additional excess air. As a result, the analysis will utilize the actual average flow rate observed during source testing of an identical crematory unit (see Attachment B) and a calculated equivalent burner rating.

The total annualized cost for the SCR system is estimated to be 43,843.62. The total NOx controlled would be 1.74 tons per year (681*5.67*0.9/2000 = 1.74). The analysis shows the cost effectiveness calculation to be 25,245.92 per ton of NOx reduced. Since the District's cost effectiveness threshold for NOx is 24,500 per ton, the addition of the SCR would not be considered cost effective.

Total Annualized Cost of SCR	Quantity of NOx Controlled (TPY)	Cost of SCR per ton removed	SMAQMD cost effective threshold for NOx	Cost effective
\$43,843.62	1.74	\$25,245.92	\$24,500	No

PM:

A screening cost effectiveness analysis was done to determine if a baghouse could be considered cost effective to control the particulate from a crematory. This analysis will assume that the baghouse will collect 100% of the particulate emissions which would be approximately 1.755 tons/yr.

Based on EPA's Cost Control Manual, 6th Edition, the total annual cost of a baghouse needed to control the flow characteristics of a crematory is estimated to be approximately \$30,351.00. The total PM10 emissions controlled would be 1.664 tons/year. The analysis shows the cost effectiveness calculation to be \$18,239.78 per tons of PM10 reduced. Therefore, the conclusion

BACT & T-BACT Determination Pet Crematory December 13, 2016 Page 9 of 26

is that a baghouse used to control particulate matter for a crematory is not considered cost effective and as such will not be considered BACT. See Appendix A for cost analysis.

Total Annualized Cost of a Baghouse	Quantity of PM10 Controlled (TPY)	Cost of a Baghouse per ton removed	SMAQMD cost effective threshold for PM10	Cost effective
\$30,351.00	1.664	\$18,239.78	\$11,400	No

A screening cost effective analysis was done for a venturi scrubber using the EPA Cost Control Manual, 6th Edition. The entire PM quantity (filterable and condensable) was used for cost effectiveness determination. A venturi scrubber system sized to control 3,341 cfm of exhaust gas is estimated to cost \$55,050.82. The total annual cost is \$33,017.79. The total PM10 emissions controlled would be 1.664 tons/year. The analysis shows the cost effectiveness calculation to be \$19,842.42 per tons of PM10 reduced. Since the system costs are greater than the District's cost effectiveness criteria, a venturi scrubber is not considered cost effective.

Total Annualized Cost of Venturi Scrubber	Quantity of PM10 Controlled (TPY)	Cost of Venturi per ton removed	SMAQMD cost effective threshold for PM10	Cost effective
\$33,017.79	1.664	\$19,842.42	\$11,400	No

SOx:

A cost effectiveness analysis was done for the control of SOx with the use of a wet scrubber. Based on the information presented in the EPA Cost Control Manual, 6th Edition, the cost of the capital equipment was selected by using the lowest surface area and subsequent cost information available in this section of the manual. For SOx, the District's cost effectiveness threshold is \$18,300 per ton. The cost of the wet scrubber was estimated to have a total annual cost of \$32,659.42 and control efficiency was assumed to be 100%. The cost of the electricity was included. The cost of caustic was not considered. The total SOx emissions controlled is 0.745 tons/year. The cost per ton removed for this control was calculated to be \$43,838.15 and therefore is not considered to be cost effective.

Total	Quantity of SOx	Cost of wet	SMAQMD cost	Cost effective
Annualized Cost	Controlled per yr	scrubber per ton	effective	
of Wet Scrubber		removed	threshold for Sox	
\$32,659.42	0.745	\$43,838.15	\$18,300	No

The EPA Cost Control Manual, 6th Edition does not have a chapter on dry scrubbers. A dry scrubber consists of a dry reactant or powder injection system and a baghouse. Costs for a dry scrubber are estimated using the equipment costs of a baghouse. Since the reference manual does not have cost information for the powder injection system, powder storage silo and powder reactant. The cost of the blower fan for the injection system was assumed to be 1/3 the size of the fan of a wet scrubber in order to determine the annual costs of the electricity for this system.

BACT & T-BACT Determination Pet Crematory December 13, 2016 Page 10 of 26

The cost of the storage silo and powder reactant were not included. The total annualized costs are estimated to be \$32,636.24. The cost per ton of SOx removed is calculated to be \$43,807.03 and therefore is not considered to be cost effective.

Total Annualized Cost of dry scrubber	Quantity of SOx Controlled (TPY)	Cost of dry scrubber per ton removed	SMAQMD cost effective threshold for SOx	Cost effective
\$32,636.24	0.745	\$43,807.03	\$18,300	No

PM + SOx:

Per the SMAQMD Procedures for Making Best Available Control Technology (BACT) and Best Available Control Technology for Toxic (T-BACT) Determinations for New and Modified Emission Units (10/15), when a control technology is expected to control multiple forms of criteria pollutants both shall be assessed for cost effectiveness. In the case of a wet scrubber, the control of SOx, and PM10 should be considered. Per the calculation method found in the document, and assuming that 100% of PM10 and SOx is removed by the wet scrubber

Max Cost = \sum (Emissions Reduced * Cost Effectiveness Value) P = Each pollutant subject to BACT

Max Cost = (1.664 ton PM10/yr X \$11,400/ton PM) + (0.745 ton SOx/yr X \$18,300/ ton SOx) = \$32,603.10/yr

Since the annualized costs of a wet scrubber or a dry scrubber with baghouse is \$32,659.42 and/or \$32,636.24 respectively and since either is greater than the Max Cost value calculated above the use of a wet scrubber or dry scrubber with baghouse is not considered cost effective.

APC Device	Total Annualized Cost	Quantity of SOx & PM10 Controlled per yr	Aggregate Max Cost Threshold for SOx & PM10	Cost effective
Wet Scrubber	\$32,659.42	0.745 tons SOx 1.664 tons PM10	\$32,603.10	No
Dry Scrubber with Baghouse	\$32,636.24	0.745 tons SOx 1.664 tons PM10	\$32,603.10	No

C. SELECTION OF BACT:

No technologically feasible control technologies were found to be cost effective and therefore not selected. BACT will be standards that have been achieved in practice.

BACTI	BACT For A Pet Crematory: 4.5 MMBtu/hr Burners @ 4,380 hours/year of operation (19,710 MMBtu/year) and ≤ 681 Tons Charge/year							
Pollutant	Standard	Source						
VOC	No Standard, Natural gas fuel and a secondary combustion chamber (afterburner) ≥ 1600 °F	SMAQMD, SJVUAPCD						
NOx	60 ppm at 3% O2 or 0.073 lb/MMBTU, measured as emissions from the fuel burning, not with the charge => $1200 ^\circ\text{F}$	SCAQMD						
SOx	No Standard, Natural Gas Fired	SCAQMD, SMAQMD, BAAQMD, SJVAPCD						
PM10	No Standard, Natural gas-fired with secondary chamber operating at ≥1600 °F	SMAQMD, SJVAPCD, BAAQMD						
PM2.5	No Standard, Natural gas-fired with secondary chamber operating at ≥1600 °F	SMAQMD, SJVAPCD, BAAQMD						
CO	No Standard, Secondary Chamber => 1500 °F	BAAQMD						

D. SELECTION OF T-BACT:

There are no Federal NSPS's, NESHAP's nor State ATCM's for this source category. None of the sources surveyed have any toxic T-BACT determinations published. The District contacted the SCAQMD, the BAAQMD and the SJVAPCD to enquire about any T-BACT determinations that may not have been published for this source category. In all cases, the T-BACT determinations were essentially the crematory's operational parameters that have been required as BACT. Therefore, T-BACT standards will be considered as meeting the BACT standards identified above.

Rolling - M5 - Results

Page 1

Printed 4/4/2013 V1.15

FACILITY DESCRIPTION

The facility tested is an Animal Incinerator. This plant includes the following equipment:

EQUIPMENT	MANUFACTURED BY	MODEL
Incinerator	Matthews	IEB Series 56

The fuel used for the incinerator during testing was natural gas.

PROCESS OPERATION

On March 20, 2013, the following process data was recorded by the plant operators:

TEST RUN	BURN TEMPERATURE	TEMPERATURE AT THE	AVERAGE
NUMBER	AT START (⁰ F)	END (⁰ F)	TEMPERATURE (⁰ F)
Run 1	1400	1550	1475
Run 2	1675	1675	1675
Run 3	1775	1775	1775

The weight processed was approximately 2,488 pounds.
